HACKATHON 2026

Vague idea
Visual
blueprint.

SystemCraft turns vague AI ideas into validated, teachable system blueprints.

CHALLENGE STATEMENT

Students learn to build AI.

But who teaches them to design AI systems?

We are responding to: the gap in AI education — people learn to build with AI, but not to design reliable AI systems.

TARGET USER & USE CASE

Who it’s built for.

01

The builder

An early-career dev who can call LLM APIs but has never designed a full system.

02

The moment

Starting a new project from a vague idea and a blank canvas.

03

The struggle

No way to tell if the design is sound before they build it.

The real bottleneck.

What they feel vs. what actually blocks them — the solution must attack the bottleneck, not the pain.

PAIN POINT

Design by guesswork

Builders copy tutorial architectures they can't explain, and only discover the flaws — hallucinations, no fallbacks, runaway cost — after they've built it.

BOTTLENECK

No way to review a design

Turning an idea into a reviewable architecture is slow and manual, and expert design feedback lives in senior engineers' heads — not in any tool a beginner can reach.

CURRENT ALTERNATIVE

What builders try today.

01

Tutorials & courses

Follow along and copy one fixed architecture — hard to adapt when your own idea is different.

02

Trial and error

Build first, discover the design flaws late. Reworking a wrong architecture is slow and costly.

03

Ask a senior or AI

Advice is slow and inconsistent, and never lands as a concrete, validated blueprint you can ship.

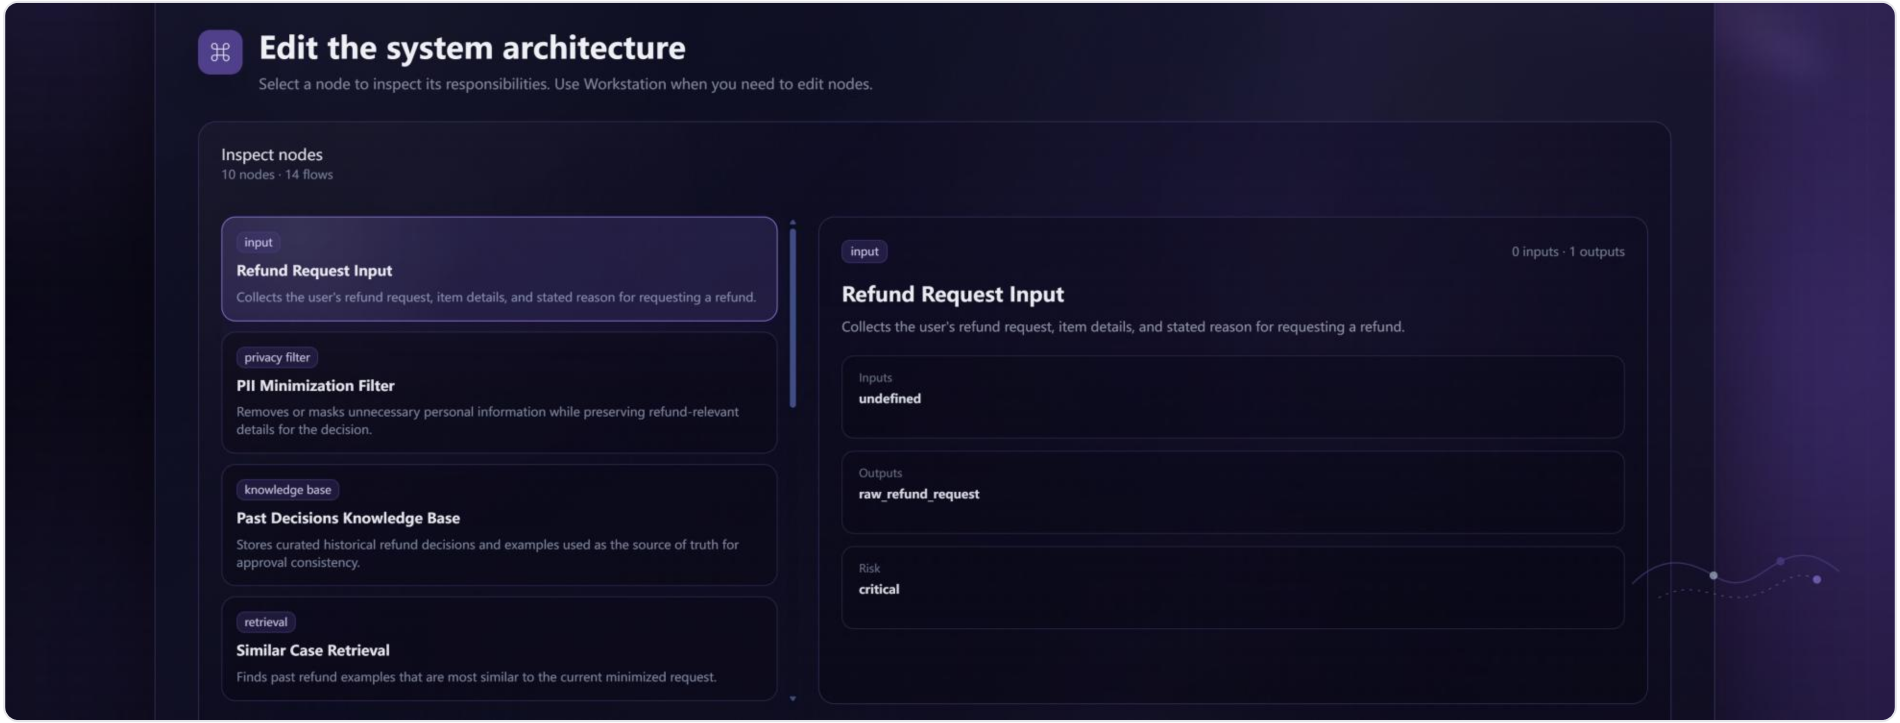
SystemCraft.

Idea in. Validated, teachable blueprint out.

Idea → Questions → Architecture → Validation → Export

Type your idea.

An idea like **“approve refunds while reducing abuse”** becomes a 10-node, 14-flow architecture you can inspect.



HOW IT WORKS · STEP 2

AI critiques your design.

Seven heuristic dimensions, scored automatically. This blueprint lands at 74/100 — and **User Control flags low at 51**, exposing the missing human-review gate before you ship.

DEMAND VALIDATION

7.4 / 10

across personas.

We ran synthetic persona reviews to stress-test demand assumptions, then identified repeated pain points around verification, failure handling, and system-level AI design.

Student
7/10

Notices reliability and safety parts beginners would skip.

Hackathon Builder
7/10

Useful for planning, pitching, and comparing designs.

Junior Engineer
7/10

Pushes thinking beyond a basic LLM wrapper.

Researcher
8/10

Citation Verifier addresses a real trust problem.

Educator
8/10

Strong teaching tool for architecture and failure modes.

Try it.
